### Rotman

# INTRO TO SQL

BTA SQL Workshop (https://tdmdal.github.io/sql-bta-2021/)

# Goal for Today (2 hrs)

- Understand what's SQL and related concepts such as
  - Database (DB) and relational DB (RDB)
  - DB management system (DBMS) and RDBMS
- Get a taste of SQL coding
  - Simple column and row operations
  - Simple aggregation
  - simple join operation

# What's SQL (Structured Query Language)

- Most widely used database (DB) language
  - a domain specific language (managing data stored in relational DBs)

- Not a proprietary language
  - Open specifications/standards
  - All major DBMS (DB Mgmt. System ) vendors implement ANSI Standard SQL
  - However, SQL Extensions are usually DB specific (SQL dialects)

Powerful despite simplicity

### What's a DB and a Relational DB

What's a database: A collection of data in an organized way

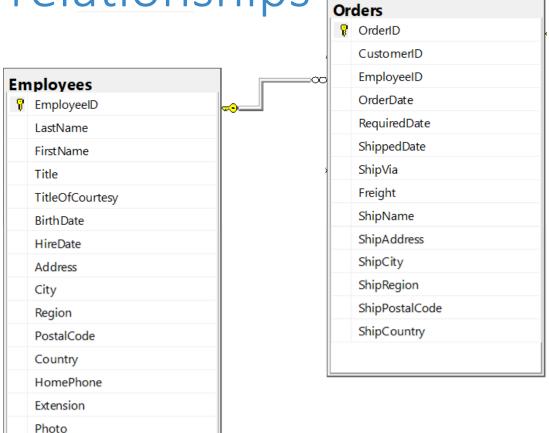

- Relational DB (RDB)
  - tables
    - columns/fields/variables and datatypes
    - rows/records/observations
  - primary key, foreign key, constraints and relationships
  - other objects: indices, views, and many more

Primary key, foreign key, constraints and

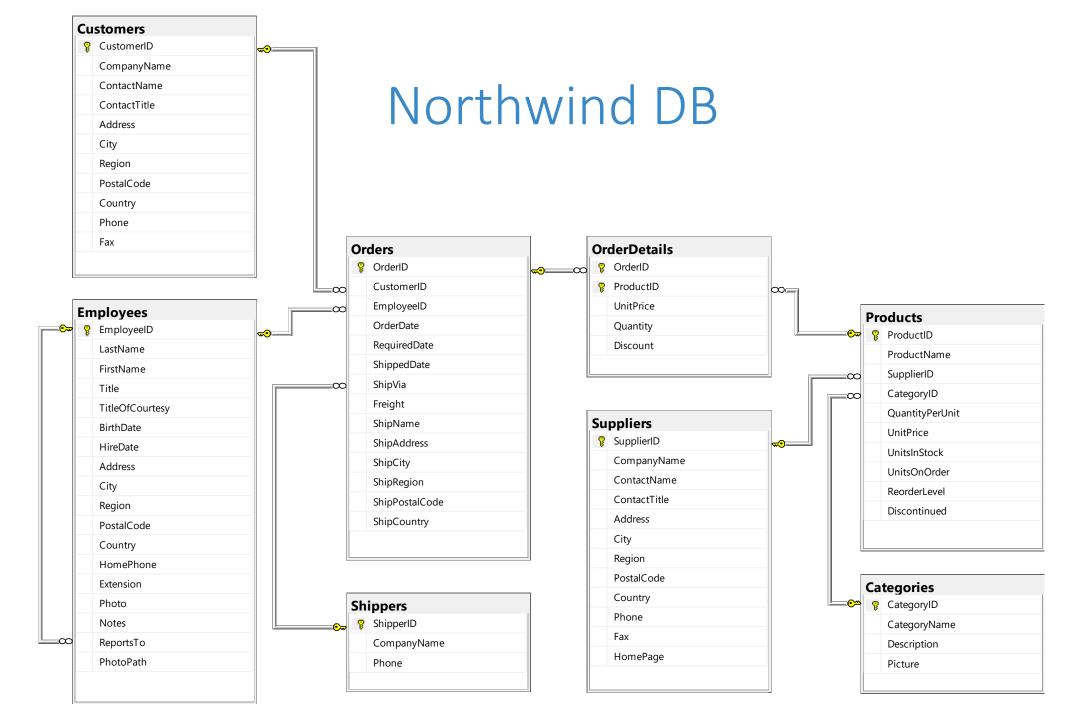

relationships

## What is a DB Management System

A software system that manages/maintains DBs

- A few examples of Relational DBMS (RDBMS)
  - Open source: SQLite, MariaDB, PostgreSQL
  - Commercial: MySQL, Microsoft SQL Server, Oracle, etc.

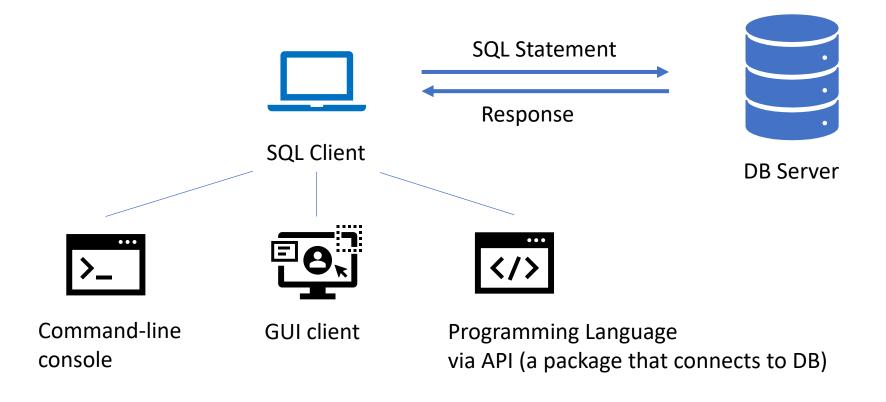

## Connect to a DB and write SQL – Architecture

Note: SQL client and DB server can be on the same computer

### Connect to a DB and use SQL — SQL Clients

- DB specific management client
  - command-line console
  - GUI (Graphic User Interface) client
    - e.g., DB Browser for SQLite, MySQL Workbench, pgAdmin for PostgreSQL, MS SSMS
- Generic DB client can connect to different DBs through connectors
  - GUI client (e.g. <u>DBeaver</u>, <u>Beekeeper Studio</u>, <u>Navicat</u>)

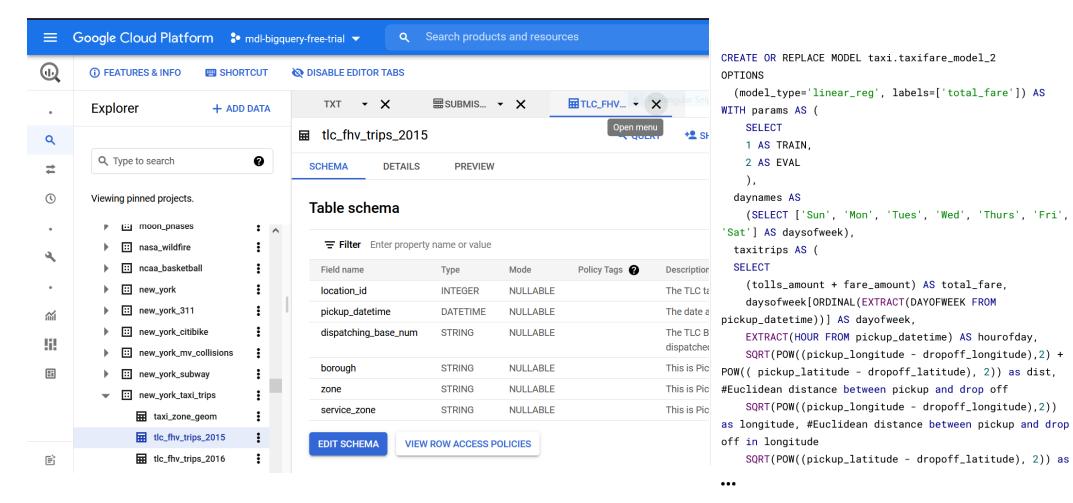

- Programming language
  - e.g., Python + <u>SQLAlchemy</u> + DBAPI (e.g. <u>SQLite</u>, <u>MySQL</u>, <u>PostgreSQL</u>, etc.), R + <u>dbplyr</u>
  - In this workshop: Python + <u>ipython-sql notebook magic</u> (depends on <u>SQLAlchemy</u>)

## Beyond a relational DB language

- SAS's PROC SQL
- Spark's SparkSQL
  - Apache Spark is a big data computing framework
- Hive's HiveQL, an SQL-like query language
  - Apache Hive is a distributed data warehouse (data warehouse?)
- Google BigQuery's SQL (a great first step to big data analysis)
  - BigQuery is Google's data warehouse (analyze petabytes of data at ease)

# Big Data ML with SQL (e.g. Google BigQuery)

Ref. Using BigQuery ML and BigQuery GIS together to predict NYC taxi trip cost

# SQL Hands-on Learning (Learning-by-doing)

Course website: <a href="https://tdmdal.github.io/sql-bta-2021/">https://tdmdal.github.io/sql-bta-2021/</a>

- Google Colab
  - Google's Jupyter Notebook
  - A notebook can contain live code, equations, visualizations and narrative text
- Why SQLite?
  - a small, fast, self-contained, high-reliability, full-featured, SQL DB engine
  - perfect for learning SQL

### Hands-on Part 1: Basics

- Retrieve data: SELECT...FROM...
- Sort retrieved data: SELECT...FROM...ORDER BY...
- Filter data: SELECT...FROM...WHERE...
  - IN, NOT, LIKE and % wildcard
- Create calculated fields
  - mathematical calculations (e.g. +, -, \*, /)
  - data manipulation functions (e.g. DATE(), | |)

# Hands-on Part 2: Summarize and Group Data

 Summarize data using aggregate functions (e.g. COUNT(), MIN(), MAX(), and AVG()).

Group data and filter groups: SELECT...FROM...GROUP
 BY...HAVING...

- SELECT statement syntax ordering
  - SELECT...FROM...WHERE...GROUP BY...HAVING...ORDER BY...

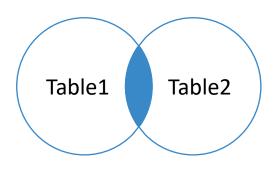

### Hands-on Part 3: Join Tables

• Inner join: SELECT...FROM...INNER JOIN...ON...

• Left join: SELECT...FROM...LEFT JOIN...ON...

Other join variations (see appendix)

### Join – Inner Join

SELECT \*
FROM Table1
 INNER JOIN Table2
 ON Table1.pk = Table2.fk;

#### Table1

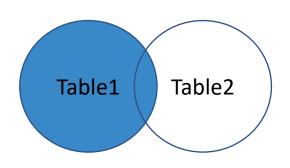

pk	t1c1
1	а
2	b

#### Table2

fk	t2c1
1	С
1	d
3	е

pk	t1c1	fk	t2c1
1	а	1	С
1	а	1	d

# Join – Left (Outer) Join

```
SELECT *
FROM Table1
  LEFT JOIN Table2
  ON Table1.pk = Table2.fk;
```

#### Table1

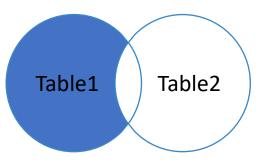

pk	t1c1
1	а
2	b

#### Table2

fk	t2c1
1	С
1	d
3	е

pk	t1c1	fk	t2c1
1	а	1	С
1	a	1	d
2	b	null	null

# Join - Left (Outer) Join With Exclusion

		pk	t1c
able1	Table2	1	a
		2	b

SELECT *
FROM Table1
LEFT JOIN Table2
ON Table1.pk = Table2.fk
WHERE Table2.fk is NULL;

able1	Tabl
-------	------

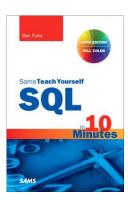

pk	t1c1
1	а
2	b

fk	t2c1
1	С
1	d
3	е

pk	t1c1	fk	t2c1
2	b	null	null

SQLite doesn't support this RIGHT JOIN key word, but some DBMSs do (e.g. MySQL).

### Join – Full Outer Join

Note: Some DBMS support FULL OUTER JOIN keyword (e.g. MS SQL) so you don't need to do it the above way.

### Join — Full Outer Join With Exclusion\*

SELECT pk, t1c1, fk, t2c1 FROM Table1

LEFT JOIN Table2

ON Table1.pk = Table2.fk

WHERE Table2.fk is NULL

## SQL is much more - 1

- Sub-query
- CTE and temporary table
- Self-join
- CASE keyword
- UNION keyword

### SQL is much more - 2

- Insert data (INSERT INTO...VALUES...; INSERT INTO...SELECT...FROM...)
- Update data (UPDATE...SET...WHERE...)
- Delete data (DELETE FROM...WHERE...)
- Manipulate tables (CREATE TABLE...; ALTER TABLE...; DROP TABLE...)
- Views (CREATE VIEW...AS...)

# The list goes on and on

- Stored procedures
- Functions
- Transaction processing
- Cursors (going through table row by row)
- WINDOW function
- Query optimization
- DB permissions & security
- ...
